                                                                                                                 can be used for producing phytasses with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             361 SWTYPFAARAYVEMMQCEAGGGGGGGGGFKEPLVRVLVNDRVVPLHGCGVDKLGRCKLDDFV 420

formulation, comprising phytase (myo-inositol hexalisphosphate formulation, comprising phytase (myo-inositol hexalisphosphate formulation, comprising phytase (myo-inositol hexalisphosphate phosphohydrolase) and one or more stabilishing agents including composition for ribitol; polyethylene glycols with a molecular weight of 600 xylitol or ribitol; polyethylene glycols with a molecular weight of formolation acid; carboxymethylcellulose; and sodium alginate. Cylustric and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a prosphorus. Although a large amount of phosphate is present in animal ceed in the form of phytate phosphorus, monogastric animals are unabble to the feed of such animals. Phytase enhances the nutritional phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for adding additional phosphate to the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the inclusion in the animal can make use of the inclusion in the control of the feed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the inorganic phosphate liberated from phytate phosphorus using the conganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents a consensus sequence, designated phytase-11, which was derived from the mature phytase sequences from a variety of fungi (AAY69544-Y69556, AAX69559-Y69562,

for use in pharmaceuticals and Novel phytases with improved properties such as temperature stability pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds

Example 2; Fig 4a-d; 240pp; English.

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g.

```

temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present

                                                                                                                                                                                                                                                                                                                                                     The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods tem be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate profile, release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate.
                                                                                                                                                                                                                              Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds -

The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate phosphohydrolase) and one or more stabilising agents including phosphohydrolase) and one or more stabilising agents including to the stabilistic polyethylene glycols with a molecular weight of 600 to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, glutaric and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a provides a monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphate is present in animal to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional phosphate value of plant material without the need for adding additional phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Phytase signal peptide from Aspergillus terreus cbs16.46"
                                                                                                                                       Phytase; myo-inositol hexakisphosphate phosphohydrolase; stabilisation; thermostable; animal feed; monogastric animal; phytate phosphorus; phosphate availibility; consensus; phytase-10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                stabilized enzyme formulation, useful for feed compositions for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       "Mature phytase-10 consensus"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (HOFF ) HOFFMANN LA ROCHE & CO AG F.

to the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion designated phytase-10, which was derived from the mature phytase, sequences from a variety of fungi (AAY66944-Y66946, AAY69548-Y69556, additionally contains the Aspergillus terreus cbs116.46 signal peptide at

```

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties engine temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it. The present sequence represents a phytase sequence from the present sequence represents a phytase sequence from the present

The invention relates to a process for preparing animal feed by agglomerating feed ingredients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgent plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed ingredient and a feed additive (phytase) simultaneously.
                                                                                                                                                                                                     Phytase; animal feed preparation; thermostable phytase; transgenic plant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                175 NNTLDHGLCTAFEDSTLGDDAEANFTAVFAPPIRARLEA-LPGVNLTDEDVVNLMDMCPF 233

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inosital phosphates and/or inosital and inorganic phosphate. The present sequence represents a phytase sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds -

increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate cleavage partern, substrate binding, position specificity, substrate cleavage partern, release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phytase; myo-inositol hexakisphosphate phosphohydrolase; stabilisation; thermostable; animal feed; monogastric animal; phytate phosphorus; phosphate availibility; consensus; mutant; mutein.

Aspergillus terreus 9A1.

10;

```
The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate phosphohydrolase) and one or more stabilishing agents including phosphohydrolase) and one or more stabilishing agents including to the phosphohydrolase; and one or more stabilishing a molecular weight of 600 xylitch or ribitol; polyethylene glycols with a molecular weight of 600 to 4000 Da, preferably 1000 to 3550 Da; the disodium salts of malonic, to 4000 Da, preferably 1000 to 3550 Da; the disodium salts of malonic, or stabilised phytase formulation is used in a method for proparing a feed composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of proyides a monogastric animal with its dietary requirements of phosphate along phosphate is present in animal feed in the form of physphate, resulting in the addition of extra to the feed of such animals. Phytase enhances the nutritional phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for adding additional phosphate to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved enzyme the phytase formulation of the invention has an improved enzyme interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents a mutant phytase-10 consensus sequence, phytase-10-thermo[3]-050T-K91A, which has a temperature optimum and melting point 4 degrees Celsius higher than that of phytase-10 (AAX69566). Its specific activity with phytate as a
                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Phytase signal peptide from Aspergillus terreus cbs16.46"

```
The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved proparties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manner, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate.
                                                                                            Disclosure; Fig 22a-c; 240pp; English.

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and Disclosure; Fig 4a-d; 240pp; English. 21-JAN-2000; 2000WO-DK00025. 99DK-0001340. 99DK-0000092 compound foods and feeds -(NOVO ) NOVO NORDISK AS WPI; 2000-491161/43. ```
value of plant material without the need for adding additional phosphate to the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate phosphohydrolase) and one or more stabilising agents including explited or ribitel; polyethylene glycols with a molecular weight of 600 to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, glutaric and succinic acid; carboxymethylcellulose; and sodium alphate. The stabilised phytase formulation is used in a method for preparing a feed composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of freed in the form of phytate phosphotrus, monogastric animals are unable to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional contraction of the feed of such animals.

12;
enzyme. The phytase formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents an initial consensus phytase sequence determined using the program PRETY from mature phytase sequences from a variety of fungi (AAY69544, Y60546, AAX69548 Y6955, AAX69564) and the Basidiomycetes phytase consensus AAY69563. This was used as the basis for the consensus phytase designated phytase-10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phytase; mutant; thermostability; mutation; mutagenesis; pH stability; temperature stability; pH profile; temperature profile; reaction rate; specific activity; substrate specificity; substrate cleavage pattern; substrate binding; position specificity; phytate degradation rate;

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate.
                                                                                                                                                                 Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and

                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents the consensus phytase-1-thermo(8)-Q5OT-K91A. The invention relates to a process for preparing animal feed by agglomerating feed ingredients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed ingredient and a feed additive (phytase) simultaneously.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PTSSKSKKYSALIERIQKNAT-FKGKYAFLKTYNYTLGADDLTPFGENQMVNSGIKFYRR 117

/note="Vector: pBACKUTCH; Site_1: HindIII; Site_2: HindIII; Rice blast is one of the most devestating fungal diseases of rice world wide. It is a filamentcus ascomycete with a haploid genome (n=") of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25x genome coverage. High density colony filters are available upon request." I others

It is a filamentous ascomycete with a haploid genome (1=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25x genome coverage. High density colony filters are available upon request. 4 to theres

It is a filamentous ascomycete with a haploid genome (i=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25% genome coverage. High density colony filters are available upon request." 3 others

```

```
a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 Kbp was, constructed. This library represents greater than 25x genome coverage. High density colony filters are available upon request."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AQ161556 810 bp DNA GSS 09-SEP-1998

a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 closes with an average insert size of 130 kbp was constructed. This library represents greater

```
a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25% genome coverage. High density colony filters are available upon request."

```

a haploid genome (n=7) of approximately 40 Mpp. Rice
blast is an important model fungal pathogen for studying
numerous aspects of the fungal-host interaction. In
order to facilitate genome wide analysis, a BAC library
containing 9216 clones with an average insert size of 130
kpb was constructed. This library represents greater
than 25% genome coverage. High density colony filters
are available upon request.
